SECTION I

PURPOSE

This user handbook provides guidance and assistance to US Army personnel requesting specific information from the Force Stratification System (FSS).

2. SCOPE

The user handbook provides a brief description of the FSS, identifies the stratification analysis report displays currently available from FSS, presents the method for requesting reports desired by the user, and shows the format in which the stratifications are displayed.

3. FORCE STRATIFICATION SYSTEM DESCRIPTION LEGGE STEAT THE SYSTEM (FS)

- a. Background and Development. When initially developed, the FSS was an automated (computerized) system designed to functionally assess and display the personnel distribution and costs of Army resources devoted to various combat and support functions. The system was developed and made operational by the Engineer Study Group, Office Chief of Engineers, Department of the Army, and was subsequently transferred to the US Army TRADOC Systems Analysis Activity (TRASANA) for TRADOC operation. In October 1975, TRASANA was designated by Department of the Army as the FSS proponent for the US Army for system operation and improvement.
- b. Improvements. Improvements were made to the FSS to more fully 45-cutilize the data base of Sections II (Personnel) and III (Equipment) of the Table of Organization and Equipment (TOE) information to sort and arrange the data in formats that are beneficial to the needs and requirements of the users. In addition to its former capabilities, the FSS can now present MOS by function, additional skill identifier (ASI), grade, and cost. Equipment can be isolated by standard requirement code (SRC), SRC paragraph, and cost for either team, company, battalion, or entire force. All the equipment of a force can be listed and totaled by line item number (LIN) and costs. Through the various sorting and arrangement processes, a wealth of data can be obtained from the FSS data base.
- c. <u>General Characteristics</u>. Force stratification is really two separate force analysis processes. The larger process is designed to analyze TOE forces by SRC for units and teams. The smaller process is designed primarily to analyze Table of Distribution and Allowance (TDA) and Modification Table of Organization and Equipment (MTOE) forces. Each process has applications to both current and mid-range force analysis. The larger process examines forces containing TOE units only whereas the smaller process examines TDA and MTOE units. The main distinction between each process is

in the quantity and type of information developed. Thus, force stratification, as an overall process, can be used to analyze either division, special mission, or general support forces for the immediate and future time frame. Specifically:

- (1) TOE Forces. Force stratification provides a new view of a TOE Army force. It allows a military planner to look beyond branches or TOE units of the force and view all resources. Force stratification displays those resources that have been assigned to a particular functional area and accounts for the number of personnel and the recurring and non-recurring dollar cost of personnel and equipment assigned to each function. It displays personnel and equipment of a force by SRC (branch or subdivision of the Army) or by individual unit, or both. It is also capable of displaying personnel and equipment by zone and by command level within the zone. For each combination of force category, zone, or command level, it is capable of presenting information on:
- (a) Span of control. The average number of subordinate units reporting to each command level.
- (b) Grade distribution. The number of personnel by grade category. These data are used by the system to compute the ratios of officers, warrant officers, and NCOs to enlisted personnel.
- (c) Beneficiaries. The beneficiaries, i.e., who does what for whom, of the various functions performed by the personnel and equipment of Army units are displayed. The beneficiaries are divided into three categories: the total force, subordinate units, or the unit itself.
- (d) Command and control. That portion of the total resources is allocated to each level of command echelon in the force.
- (e) Staff support. That portion of the total resources that is allocated to the planning function; the balance is allocated to operating functions.
- (f) Centralization/decentralization. The degree to which the resources devoted to various functions are operationally controlled at various echelons or equivalent command levels within the Army hierarchy.
- (g) Personnel and equipment data. In addition to the above, personnel and equipment data can be sorted in various forms and arrangements and can be retrieved from the FSS data base by either team, company, battalion, or force. For example, the entire TOE file can be searched and

¹² ones include the communications and combat zones, with the combat zone further subdivided by corps and division area. Command levels include the complete range of headquarters from team up through theather Army headquarters.

sorted to find those SRCs (TOEs) that have specific type(s) of equipment or personnel. This can be done by LIN for equipment, MOS, grade, function, or any combination of identifiable known data from Section II or III of the TOEs. This data can also be functionalized and costed if desired.

- (2) TDA/MTOE forces. The TDA/MTOE force analysis process was developed later as an extension to the larger process and is continually being expanded. Eventually, it may have the same capabilities as the TOE process. Although it was designed primarily to examine civilian personnel² of TDA units, it addresses both military and civilian personnel of either TDA or MTOE units. However, since some of these units have no combat orientation, many of the capabilities of the larger process were submerged, e.g., capabilities to display a force subdivided by SRC, zone, command level. As a result, this portion of the FSS is presently a functional classification process capable of providing:
- (a) A functional classification of military and civilian personnel. It presents both the number of personnel and the recurring dollar cost of personnel performing each function.³
- (b) The grade distribution of military and civilian personnel. This data is used by the force stratification process to develop such information as the ratios of military to civilian personnel, high grade personnel, and white-collar to blue-collar personnel.

d. Design

(1) General

- (a) The input to force stratification can be either an individual unit, team, a theater force, or a total Army force by SRC or unit identification code (UIC). Force stratification processes Army units by first determining the resources authorized to the units and then sorting and classifying those resources by operational characteristics and function. This procedure is accomplished by means of the computer programs that sort and classify the resources and of the two types of data files within the system library.
- (b) One data file contains coded information on personnel, equipment, and units. It contains functional coding for all special skill identifiers (SSIs) and MOSs, civilian job specialties, and all TOE items of equipment.

²General Schedule (GS) and Wage Board (WB) personnel.

³Since the equipment authorizations of TDA and MTOE units are extremely variable, the capability to functionally classify equipment costs for TDA/MTOE is not currently built into the process.

It also contains functional and operational characteristic coding for all TOE units. The file is updated as changes occur.

(c) The second data file contains the most current information available and is obtained directly from other Army force planning and accounting processes. It contains the master authorization data required by FSS to determine the quantity of resources assigned or authorized to TOE, TDA, and MTOE units. It also contains information on the dollar cost of personnel and equipment. The information on TDA and MTOE units is obtained directly from The Army Authorization Documents System (TAADS) file; information on TOE units is obtained from the TOE Master File maintained by the US Army TRADOC. Cost information, which has been approved by the Comptroller of the Army, is obtained from US Army Management Systems Support Agency (USAMSSA), Force Cost Information System (FCIS).

(2) Stratification process

CONTRACTOR DECENSION STATES OF STATE

- (a) Functional classification. Force stratification is a multiphase sorting and classification process. The first phase deals with sorting and classifying resources based on the functions they perform. The 64 functions examined by force stratification are shown at Appendix A, Display A. They range from combat functions such as infantry, armor, artillery, and aerial fire support to combat service support functions such as administration, food service, and data processing. These functions are unique to force stratification and represent a detailed look at resource allocations. However, for ease of discussion, the functions are also "rolled up" into 10 summary functions.
- 2. Equipment. As noted earlier, force stratification examines equipment for TOE units and forces only. This examination is primarily for determining the cost of equipment. However, the quantity of each equipment item is also available. The data file internal to force stratification contains all TOE equipment items that are functionally coded and costed.

These items represent all of the equipment costs determined by the Comptroller of the Army within the Army TOE force. Force stratification also sorts items of equipment from each TOE paragraph and classifies them functionally in a manner similar to that used for personnel. The end product of this sorting and classification process is the cost of equipment used in performing each of the 64 functions.

- (b) Operational classification. The second, third, and fourth phases of the multiphase sorting and classification process deal with the operational characteristics of the resources. As the multiphase sorting process proceeds, a "score sheet" on the distribution of resources is developed and eventually displayed. The following are examples of other information that is available:
- 1. Beneficiary. There are three beneficiary categories: external (functions performed for the entire force), internal (functions performed only for the unit to which the resource is assigned), and subordinate (functions performed for subordinate units). This capability was built into force stratification to determine which resources within a force are making the most direct contribution to the overall mission of the force. For example, a resource (personnel or equipment) performing an external function and located in the division area makes a far more direct contribution to the force's overall mission than a resource located in the COMMZ and performing an internal support function. This capability provides the military planner a better understanding of which resources (personnel and equipment) within a total force could be eliminated with the least direct effect on total force effectiveness.
- 2. Command level. This process identifies the level at which the function is being performed. There are nine separate levels, ranging from team, company, and battalion to Theater Army level. The resources that appear at each level are those organic to the headquarters and headquarters companies of each command level. This capability provides new visibility to the functions actually performed by higher headquarters, the cost at each level, and variations in those costs relative to location (areas) and command level within each area.
- (c) Other design characteristics. There are currently three additional force stratification dimensions, or capabilities. It is through these capabilities that force stratification gains additional strength as a force analysis tool. In combination with the data cited above, these capabilities allow a military planner to focus on specific elements of the Army and gain new insights into the design and structure of units, branches, and total Army forces. Specifically:
- 1. Stratification by branch and area. Force stratification can subdivide a troop list by branch and by area. The branch subdivision is

accomplished by the computer use of SRCs, 4 and the area subdivision is accomplished by the computer use of codes assigned to each TOE unit. The capabilities of subdividing by area and branch were built into the system to provide the military planner a better view of the total Army organization, thereby bridging the gap between the unit design process, which is concerned primarily with individual units, and other units of the branch. These two capabilities enable the military planner to conconduct detailed examinations of a total branch and, more importantly, a branch within the context of a total force. Rather than looking at individual units, the planner can see what level of internal support, e.g., maintenance, medical, personnel services, has been provided to the entire branch. He can also see how this support varies by area and by command level within the area. He is able to identify the beneficiary of this support, the dollar cost of the support (for both personnel and equipment), and how the dollar cost varies, depending on the grade of the personnel providing the support.

- 2. Centralization/decentralization. Force stratification can portray the echelon below Theater Army headquarters at which the various functions are operationally controlled. The command level information described above relates only to command and control units, i.e., headquarters and headquarters units, whereas the operational control information relates to all units within a force. For example, a transportation company might be assigned directly to the Theater Army headquarters. All functions performed by this unit are, therefore, under the direct operational control of Theater Army headquarters. If the same unit is assigned directly to the transportation command within the COMMZ, the operational control would be three levels removed from Theater Army headquarters, i.e., operational control would be from Theater Army headquarters through the Theater Army Support Command (TASCOM) and the transportation command to the unit. Force stratification, therefore, can portray the echelon within each branch at which the various functions (external, internal, or subordinate) are operationally controlled.
- 3. Span of control. Another capability of force stratification is its ability to determine the number of subordinate units reporting to each branch of the force subdivided by area. The span of control information is computed based on the number of units directly subordinate to each command level. In combination, these two sets of information provide invaluable information on the "whys" of command and control, or higher headquarters, costs.

⁴The SRC is a nine-position code, the first two positions of which indicate the branch or major subdivision of the TOE. It is through the use of these first two numbers that the system is able to subdivide the total force by branch.

- (d) Systems limitations. Although force stratification has many strengths, it also has limitations as follows:
- 1. Does not structure forces or design units. It has no built-in workload or allocation rules. It is designed to begin where the current force planning process ends. It provides a detailed examination of units and forces which have been developed by current unit design and force structuring specialists with a new view of the units and forces they have developed. Thus, it is designed to complement the current force planning process, not replace it.
- $\underline{2}$. Has no built-in interpretive capability. Although it can isolate and highlight inconsistencies and abnormalities in unit designs and force structures, it provides no proof that these conditions are incorrect. It is the user himself who must develope this proof based on an analysis of each specific anomaly.
- $\underline{3}$. Cannot predict the net effect on any proposed changes in the design of a unit or the structure of a force, However, a proposed unit, i.e., conceptual unit or force, can be stratified for comparison.

(3) Application

- (a) General. Force stratification has utility as a planning tool for force structuring and unit design. It can be used to examine the allocation of resources for unit, battalion, division, corps, and Army forces. It can be used for each force category to conduct a detailed examination of resource allocations and to provide a new view of unit design and force structuring process. It has application to the entire span of the Army Planning, Programming, and Budget System (PPBS) and Cost and Operational Effectiveness Analysis (COEA) and to a broad range of Army analytic and budgeting activities.
- (b) Specific. Force stratification is both an inquiry and force planning tool.
- 1. As an inquiry tool, force stratification can answer a broad range of frequently asked questions. Examples of a few are as follows:
- <u>a.</u> What is the combat-to-support ratio of either the division, special mission, general support forces, or the total Army force? For the Theater-deployed division forces, how does this ratio vary within zone?
- <u>b.</u> What percent of a force's resources is allocated to: Maintenance by type, i.e., aircraft, electronic, ground vehicle? General services by type, i.e., food service, ADP support, legal support? Supply by type, i.e., general supply, ammunition, POL?

- c. What percent of the personnel assigned to branch TOE units is actually performing the branch mission? For those personnel not performing the branch mission, what functions are they performing and for whom?
- \underline{d} . What percent of the branch mission is actually performed by TOE units of that branch? What percent of the branch mission is performed by personnel assigned to other branches, e.g., medical personnel assigned to non-medical TOE units?
- 2. As a force planning tool, force stratification has application in both the force structuring and unit design processes. Examples are as follows:
- <u>a.</u> Force structuring. Force stratification can be used to determine the effects of changes in force structuring guidance, principles, or methods. Representative of the types of questions that force stratification can answer are "How much medical support is provided by medical personnel assigned to non-medical TOE units and what type medical support is it, e.g., preventive medicine, emergency treatment, evacuation, and rescue?"
- <u>b.</u> Unit design. Force stratification provides a tool for analyzing the economy of unit design. It is capable of answering such unit design questions as "For the division forces, does the level of clerical and administrative support exceed guidelines?" Does the distribution of food service personnel reflect centralization (decentralization) of the food service function?" "How does this level of support vary between branches, command levels, and zone?" "Which branch, command level, or zone contains the fewest personnel devoted to this function?"
- c. Personnel and equipment applications. FSS can, by sorting and selection processing, isolate or display personnel and equipment data in many forms. For MOSs, it can display individual MOSs in a force or a family of MOSs, i.e., all electronics-oriented MOSs. It can identify the units by SRC that the MOS(s) are authorized. The FSS functions and costs associated with the MOS and SRC can also be displayed. Equipment items can also be displayed in the same manner as MOSs. A single LIN of equipment of an entire force or of all TOEs in the Army can be isolated and displayed by SRC, SRC quantity, cost, and total quantity.
- d. Other applications. The applications cited above are by no means exhaustive. As force stratification gains acceptance and use by agencies of the Army, military planners from those agencies will undoubtedly find many other direct and indirect applications. Overall, force stratification will help the executive review and will monitor trends in the organization of the Army. Force stratification will also help the action officer or research analyst build that organization.

4. STRATIFICATION OF CONCEPTUAL UNITS

Force stratification can stratify conceptual TOE units in the same manner as DA approved TOE units. To stratify conceptual units the user must furnish specific data listed below for the three sections of the TOE, namely Sections I, General; Section II, Personnel and Section III, Equipment. Section II and III data in the specific format asked for is required to load the data files of FSS to provide the stratification. Section I data is analyzed and coded for inclusion in a special data file that provides hierarchal data for the unit being stratified, such information includes, type of unit, mission or function, senior head-quarters, unit distribution in the Theater of Operation, operational area, etc.

- a. Section I. This section contains the general information of a TOE such as missions(s), assignment, capabilities, basis of allocation, category, related authorizations, etc. For force stratification only the data on the units mission, assignment, basis of allocation and category is required. A sample of Section I is shown in Appendix B.
- Section II. Section II contains the pertinent data of all personnel authorized by the TOE by individual paragraph. The data in this section includes paragraph number, line number, paragraph heading, position title, grade(s) authorized, MOS, branch (for officers only and the code NCO for Non-Commissioned Officers), authorizations by strength levels, additional skill identifier (ASI) and coded remarks. The information listed above is required in Section II for al! conceptual TOES. A sample of Section II is shown in Appendix B. Section II of the Conceptual TOE as shown in Appendix B should be provided on DA Form 2949, or on blank paper in the same format if DA Form 2494 is not available. Preferably for those users having a punch card or computer capability, Section II can be submitted on punched cards or magnetic tape in the format shown in Appendix B. All MOS listed in the conceptual TOE should be authorized in ARs 611-101, 611-112, or 611-201. However, if a conceptual MOS(s) is required in the TOE, the user must provide a job description of the MOS(s) along with the conceptual TOE in order that the MOS be analyzed and coded for inclusion into the FSS MOS file. If cost reports are required by the user, the conceptual MOSs estimated training cost must be included or it should be related to a current MOS cost.
- c. Section III. Section III contains the authorizations for all equipment by Line Item Number (LIN) in the TOE for each paragraph and the recapitulation of all equipment contained in the TOE. The data in this section includes the paragraph number, line item number (LIN), equipment description, quantity authorized by equipment level and a coded remarks column. The equipment data listed above is required for all conceptual TOEs. A sample of Section III is shown in Appendix B.

Section III as shown in Appendix B should be provided on DA Form 2950 for a Conceptual TOE, or on blank paper in the same format if DA Form 2950 is not available. Preferably for those users having a punch card or computer capability, Section III can be submitted on punched cards or magnetic tape in the format shown in Appendix B. If a new or conceptual piece of equipment is required in the TOE, the user must furnish a description of the equipment and an estimated cost if cost reports are required.

d. Additional information or questions on stratification of conceptual units should be submitted to Director, US Army TRADOC Systems Analysis Activity, ATTN: ATAA-TDA, White Sands Missile Range, New Mexico 88002 or by calling Resource Analysis Branch, AUTOVON 258-1008/1036.

5. RECOMMENDED CHANGES

Users of this handbook are encouraged to submit changes and comments to improve the usability of the FSS and this handbook. Comments should be keyed to the specific page, paragraph, and line of the text for which the handbook changes are recommended. Rationale is requested to insure understanding and evaluation. System recommendations should be in letter form, while comments should be prepared using DA Form 2028, "Recommended Changes to Publications," and forwarded to the Director, US Army TRADOC Systems Analysis Activity, ATTN: ATAA-TDA, White Sands Missile Range, New Mexico 88002.

SECTION II

1. USE OF HANDBOOK

The FSS can aid users in force planning and unit design by providing new insights through functional analysis. Appendix A of the handbook shows the various stratification displays that may be obtained through the FSS. Corresponding narrative descriptions are provided for each display. Stratification displays currently available range from functions by branch and manpower distribution (strengths and percentages) to grade distributions and cost data (recurring, non-recurring, per capita, and percentages). Generally speaking, any information contained in a TOE can be stratified and displayed for a user. Currently, MTOE or TDA data can be stratified to provide only limited data on personnel (strength percentages and grades) by functions. Advance coordination with the TRASANA Resources Analysis Branch may reveal that special displays can be adapted which will display user requirements in a manner better suited to user needs.

2. REQUESTS FOR STRATIFICATION

Organizations requesting the stratification analysis of units or forces should submit their requests by letter to the Director, US Army TRADOC Systems Analysis Activity, ATTN: ATAA-TGR, White Sands Missile Range, New Mexico 88002, with a copy to Commander, Training and Doctrine Command, ATTN: ATCD-AO-R, Fort Monroe, Virginia 23651. The request should contain the data listed in Section II, paragraph 3, and should identify the desired displays, by number, from Appendix A. Requests for stratifications are processed on a first-come-first-served basis unless rationale is provided for supporting special handling. The justification for a stratification shall be made in sufficient detail to allow HQ TRADOC to set job priorities for TRASANA should a conflict arise. Every effort is made to minimize the time required to process a request for stratification; however, it is anticipated that the turnabout time from receipt of a request similar to that shown at Appendix B to mailing of the FSAR is about 5 working days. The HQ TRADOC will task TRASANA to proceed with with the required stratification and forward the data to the requesting organization. The troop list or units for stratification can also be submitted on magnetic tape or punched cards as an inclosure to the stratification request. When magnetic tapes or punched cards are used, the format must be included. A sample Format of a completed FSAR is shown at Appendix A.

3. INPUT DATA REQUIRED FOR STRATIFICATION

a. $\overline{\text{TOE}}$. The required input from the requestors for reports from FSS is the SRC, quantity of each SRC, and level of strength of each SRC. Forces composed of units larger than battalions must be broken down to

to have each unit SRC listed to battalion or lower SRCs. The SRCs are constantly being added to the TOE listing, being changed, or deleted. Consequently, the user must either state the specific date of issue of TRADOC Pamphlet 310-4 which reflects the SRC identified for stratification or a specific date wherein the TOE data is "frozen".

b. MTOE/TDA. Reports that are generated for MTOE/TDA stratified data must be identified by their UICs rather than by SRC. The UIC must be provided for each unit with the troop list that is to be stratified. The MTOE/TDA data cannot be combined with TOE data in the same force stratification. The user must state the specific date the UIC data is to be "frozen," i.e., the "as of" date.

4. REPORT FORMAT AND AVAILABLE DISPLAYS

The stratified data is provided to the user in the form of FSARs which are divided into two parts, as described below, and are subdivided into displays as shown in Appendix A.

- a. Part I consists of 14 displays (A through I and Cl, El, Fl, Gl, and G2). Displays A, B, C, and Cl, which are sorted data but not stratified data, are included in each report as information pertinent to both TOE and MTOE/TDS data inputs. Displays D, E, F, G, H, and I are likewise automatically included in all reports using TOE data inputs; however, since these displays result only from TOE stratifications, they are not included and are not available from MTOE/TDA inputs. Displays El, Fl, Gl, and G2 also result from TOE stratifications; however, they are provided only upon request since they are modifications of Displays E, F, and G. The index in Appendix A provides a complete listing of stratification displays of title.
- b. Part II contains the automated stratification displays (other than Displays El, Fl, Gl, and G2) that are available from the FSS model by user selection. Displays l through 20, lA, 2A, and lOA, and 24 through 27 are additional stratifications available only from TOE data inputs. Displays 21, 22, and 23 are the only automated stratifications available from MTOE/TDA data inputs. To assist the user in selecting the displays desired in Part II of requested reports, each display is discussed separately in Appendix A.

SECTION III

DEFINITIONS

- 1. Echelons (Below Theater) Subdivisions of headquarters at levels which are subordinate to Theater Army headquarters. The designation "1st Echelon" refers to those units that are one level below Theater Army and who report directly to Theater Army headquarters. Likewise, "2d Echelon" means that a unit has one additional headquarters between it and the Theater Army headquarters. In normal progression the echelons below theater are: Field Army. Corps, Division, Brigade, Group or Regiment, Battalion, Company and Team. A line company at the fifth echelon has its company headquarters five levels below Theater Army. Headquarters and Headquarters Company units are designated at the level of the headquarters and not the headquarters company.
- 2. Force Stratification System
- An automated system designed to catalog, display, and assess Army personnel and costs devoted to the combat and support functions listed in Appendix A, Display A.
- 3. Force Stratification System Functions
- Sixty-four coded and ten summary functions to describe Army related activities. These functions are listed in Appendix A, Display A.
- 4. Level of Strength
- The personnel and authorization in accordance with capabilities and/or mission as approved in TOE. Levels of strength are: 1 (100%), 2 (90%), 3 (80%), Type A (augmentation), Type B (military supervisors and indigeneous personnel) and Ladre. TRADOC Pamphlet 310-4, as well as each SRC, lists these levels of strength.
- 5. Line Item Number (LIN)
- A number assigned to a generic nomenclature for identifying the line on which the item is listed. The LIN is used as a tool for sorting items in sequence. It is also used in supply management for consolidating all federally stock-numbered items to which it is related.

- 6. Military Occupational Specialty (MOS)
- A term used to identify a grouping of duty positions possessing such close occupational or functional relationship that an optimal degree of interchangeability among persons so classified exists at any given level of skill.
- 7. Specialty Skill Identifier (SSI)
- An identification of specific skill requirements within a grouping of duty positions and having skill and job requirements and the corresponding qualifications possessed by commissioned officers (AR 611-101).
- 8. Table of Organization and Equipment
- A table that prescribes the normal mission, organizational structure, and personnel and equipment requirements for a military unit and is the basis for an authorizations document.
- 9. Modification Table of Organization and Equipment (MTOE)
- A table that prescribes in a single document the modification of a basic TOE necessary to adapt it to the needs of a specific unit or type of unit.
- Standard Requirements Code (SRC)
- A basic set of codes, integral to each current TOE for the purpose of expressing each and every possible combination or variation thereof which, when associated with organizational data, is the basis for personnel and supply computations (AR 310-31).
- 11. Table of Distribution and Allowances (TDA)
- A table which prescribes the organizational structure, personnel and equipment authorizations, and requirements of a military unit to perform a specific mission for which there is no appropriate TOE.
- 12. Unit Identification Code (UIC)
- A code to identify uniquely each unit of the Active Army, Army National Guard, United States Army Reserve, and Army of the United States (AR 310-49).

DISCUSSION: Display B is a reference listing of the units stratified in the Force Stratification Analysis Report. The units are listed by SMC. Fitle of SMC, SMC Strength and its corresponding level of strength, the quantity of each SMC in the total force, and the total strength of the SMC. The total SMC strength is found by multiplying the SMC strength times TME QUANTITY OF SMC'S IN FORCE. The SMCs and their associated level of strengths are required inputs to the FSS model when stratifying TOEs. This display is not currently available for stratification of MTOE/TDA data. The length of this display will vary from one to about seven computer pages, depending upon the composition and size of the force stratified.

DISCUSSION: Display C is a listing of SSIs (Speciality Skill Identifier) and MOSs within the within the stratified force for officers, warrant officers and enlisted personnel by SSI and MOS, title of the MOS and the quantity of each MOS in the force. ROMOSS is the abreviation for Revised Officers Occupation Speciality System or SSI. This sample display lists only the officer-assigned SSIs in this force. The length of this display will vary from 3 to about 35 computer pages, depending upon the size and composition of the force stratified.

	10000000000000000000000000000000000000	410 FERMAN 410 FE

DISCUSSION: Display C1 is similar to display C with the addition of Additional Skill Identifier (ASI) in the column after MOS. Display C has only one entry for MOS 13400, Cannon Field Artillery Officer with a quantity of 14. Display C1 has three entries for MOS 13400, it lists individuals who are assigned only MOS 13400, quantity 8: MOS 13400, ASI 5H, quantity 3 and MOS 13400, ASIS 5H and 5H. Each time an ASI or ASIS of the same MOS change the MOS and quantity are listed with the different ASI or ASIS. The length of this display will vary from 3 to about 40 computer pages, depending upon the size and composition of the force stratified.

DISCUSSIUM: Display D lists the 64 FSS functions and categorizes them into three functional elements — combat, combat support, and combat service support for the stratified force. The display lists the function, function title, personnel strength, percentage of the total force devoted to each function, the totals contained within each functional element, and the combined total for the force. This breakdown is in consonance with the information contained in FM 100-5, "Operations of Army Forces in the Field," Chapter 4. This display is not currently available for stratification of MTOE/TDA data. The length of this display is one computer page regardless of the composition and size of the force stratified.

DISCUSSION: Display E provides manyower distribution data for the stratified force by summary function for each area, i.e., total force, Division. Corps, Army, and CONNIZ, by quantity and percentage in each area. The TOTAL FORCE column lists the number of personnel performance of the total force performing the summary function. The AREA columns list the rumber of personnel performing each summary function and the percentage of the total functional effort performed in that area. For example, of the BSTAX of the total force) performing Summary Function Number V, 39.22x, or 33.47x of the total force) performing it in the Corps area. The summary information listed is found by totaling the personnel strength columns individually for each area and Total Force. The length of this display is one computer page regardless of the composition and size of the force stratified.

DISCUSSION: Display El provides manpower and percentage data for the stratified force by the 10 summary functions for the Division and Corps areas and the total force. This display is comparable to Display E except that Corps limit nas been imposed. This limitation redistributes personnel found in the Army and CUMM2 areas so that they are aggregated in total into the Corps area. The length of this display is one computer page regardless of the composition and size of the force stratified.

DISCUSSION: Display G shows the personnel distribution of each FSS function by MOS, ASI and MOS Title. It identifies all of the MOS by ASI in the stratified force performing each function and the quantity of each MOS-ASI combination performing that function. This display illustrates only the Mortar, Rocket and Artillery function, Function Number 4, and the MOSs associated with that function. In this force there are 10 personnel with MOS 13AOO, ASI 5H performing function 4. The length of this display will vary from 1 to about 64 computer pages, depending upon the composition and size of the force stratified.

THE PRODUCTION OF THE PROPERTY OF THE PROPERTY

DISCUSSION: Display GI is similar to G with the addition personnel grades in the column to the left of the MOS. Each grade with the same MOS and quantity, will be listed e. g., an O3 (CPT) with an MOS of 13A00 will be listed along with an O2 or O4, MOS 13A00 and the quantity of the grade and MOS. The length of this display will vary from 1 to about 75 pages, depending upon the size and composition of the force stratified.

DISCUSSION: Display H is a recapitulation of all equipment in the stratified force. The equipment is listed in Line Item Number (LIN) Sequence with description and the total quantity of each item in the force. The display also provides the cost for each and total quantity of each LIN for Recurring (Annual) and Nonrecurring (Initial) dollars. Using the fifth line as an example, the LIN is A32568, the description is Alarm Chemical Agent with a total quantity of 5 in the force. Next the Recurring cost for each is \$1020 and the total Recurring cost for each is \$3754 with a total Nonrecurring cost of \$18770. In certain cases a LIN will be duplicated, the first LIN will have a double asterisk after the LIN and the Recurring cost. The following LIN will not be asterisked and will have a lower Recurring cost. The LIN with the higher cost and the double asterisk denotes that the additional cost is for combat units for ammunition used during annual service practice. The length of this display will vary from I to about 175 computer pages depending upon the composition and size of the force stratified.

DISCUSSION: Display I gives the total force cost by Nonrecurring (initial) and Recurring (annual) for both Personnel and Equipment in the total force. The total personnel strength of the force is listed at the bottom of the report. The length of this display is one page regardless of the composition and size of the force stratified.

DISCUSSION: Display I is available for each branch in the stratified force and provides manpower distribution data for the total branch and for each area, i.e., Division, Corps, Army, and COMMZ. The TOTAL BRANCH column lists the number and percentage of personnel within the branch wno are assigned to each of the 64 FSS functions. The four AREA columns list the numbers of personnel in the specific branch performing specific functions in each area. It also lists the percentage of the total functional effort being dwithin that area. For example, of the 9 men or 0.12% of the branch force performing FSS function Number 10, 3 men or 33.3% are performing it in the Division area. For or 55.55% are performing it in the Corps area; and 1 man or 11.11% is performing it in the Army area. For illustration, only the first 22 functions of the 05 Engineer Branch are shown. The length of this display will vary from 1 to about 75 computer pages, depending upon the composition and size of the force stratified. Display 1 is available for each branch in the stratified force and provides manpower distribution data for the total branch and

DISPLAY - 1A

1.50 00 00 00 00 00 00 00 00 00 00 00 00 0
PRANCH COCCUSTORY COCC

DISCUSSIUM: Display 1A is available for each branch in the stratified force. It provides manpower distribution data for the Division and Corps areas and for the total branch for the 64 FSS functions. This display is comparable to Display I except that a Corps limit has been inpused. This limitation redistributes personnel found in the Army and COPMZ areas so that they are aggregated in total into the Corps area. For example, of the 9 men, or 0.12% of the Engineer Branch, performing FSS Function Number 10, 3 men, or 33.33%, are performing it in the Display area. For illustration, only the first 22 functions of the 05 Engineer-ing Erach are shown. The length of this display will vary from I to about 75 computer pages, depending upon the composition and size of the force stratified.

DISCUSSICH: Display 2 is available for each branch in the force and is comparable to Display I except that it consolidates information on each of the 64 functional areas into the 10 summary functions. The number and percentage of personnel assigned to each of the 10 summary functions are displayed in the Total Branch column, as well as separate totals and percentages for each area; i.e., Division. Gorps, Army, and COWAL. For example, of the 7591 men in the Engineer Branch, 123 men, or 1.62% of this branch, are performing Summary Function II. Of these 123 men, or 2.44%, are located in the Division area; 113 men, or 91.87%, are located in the Corps area; 6 men, or 4.88%, are located in the Army area; and 1 man, or 0.81%, is located in the COWMS area. The summary information listed is found by totaling the personnel strength columns individually for each area and total branch. For illustration, only the 05 Engineer Branch is shown. The length of this display will vary from 1 to about 25 computer pages, depending upon the composition and size of the force stratified.

DISCUSSION: Display 3 lists manpower distribution data by echelon below theater for each area and is available for each branch and for the total force. However, only the total force is illustrated in this sample display. The TORLE column shows, by echelon, the total manpower assigned and the percentage of the total force represented by that figure. The designation "list Echelon" refers to those units that are one level below theater army and report directly to theater army headquarters. Likewise, "2d Echelon" means that a unit has one additional beadquarters between it and the theater army headquarters. A line company at the fifth echelon has its company headquarters five levels below theater army. Headquarters and inadquarters company (HILL) units are at the level of the Headquarters and inadquarters company (HILL) units are at the specific echelon at which they are company. The ARRA columns (Univision, Army, Corps. COMMIS) list the manpower assigned to each area. For example, of the 15,801 men, or 16,18% of the total 97,670 han force, performing at the 4th echelon, 6676 men, or 42.25%, are assigned in the Division area; 3665 men, or 23.19%, are assigned in the Corps area; ally men, or 26.57%, are assigned in the Army area; and 1261 men, or 7.98%, are assigned in the Conformation listed is found by totaling the personnel strength columns individually for each area and total branch. The length of this display will vary from 2 to about 26 computer pages, depending upon the composition and size of the force stratified.

DISCUSSION: Display 4 is available for each branch and total force and shows, by echelon of command, the percentage of the total force man-power that is assigned to each of the 64 functions. For example, 0.03% of the total force is assigned to the Air Dispase Function. Nurber 7, at the third echelon which is three corrund levels below theater army. Additionally, 0.38% is assigned at four levels below the theater army, 2.70% is assigned at the fifth cuholon, and 0.03% of the total force is assigned at the sixth echelon. Only the first 22 func-tions for the total force are flustrated in this sample display. The longth of this display will vary from 5 to about 78 conditor pages, deconding upon the composition and size of the frace stratified.

CONTRACTOR CONTRACTOR DATE OF THE SECOND

DISCUSSION: Display 5 is available for each branch and total force and shows, by echelon of command, the percentage of the total force man-power assigned to each of the 10 summary functions. This display is comparable to Display 4 except that the 64 FSS functions are consolidated into the 10 summary functions. This sample display illustrates only the total force. The length of this display will vary from 2 to about 26 computer pages, depending upon the composition and size of the force stratified.

heneficiaries internal to each organization. The TOTAL BRANCH column shows the number and percentage of assigned personnel who are performed as supply clerks or fined service personnel assigned within a company. The percentages in the DIVISION CORPS, ARMY, and COMMIS are the percentage distributions in each respective area with reference to the TOTAL BRANCH; CORPS, ARMY, and COMMIS are the percentage distributions in each respective area with reference to the TOTAL BRANCH; and listed for each echelon. For example, of the 7591 men assigned to the 05 Engineer Branch 194 ren, or 2.55% of the 05 Engineer Branch are assigned at the 4th echelon. Of the 194 men, 96 men, or 49.48%, are in the Corps area, and 73 men, or 33.63% are in the summary information listed is found by totaling the personnel strength columns individually for each area and total branch. For completeness of analysis, Displays 2, 7, 8, and 9 should be requested in conjunction with Display 6. For illustration, only the 05 Engineer Branch is shown. The length of this display will vary from 1 to about 25 computer pages, depending upon the composition and size of the force stratified.

BRANCH SUMMARY SUBURDINATE INFORMATION FOR 05 ENGINEER

###

DISCUSSION: Display 7 is available for each branch and reflects the manpower distribution of those units that are performing functions for beneficiaries at a subordinate level. The TOTAL BRANCH column shows the number and percentage of the assigned personnel in a particular branch who are performing functions in support of subordinate units, e.g., battalion maintenance or battalion supply personnel satisfying a requirement at the company level or lower echelon. The percentages in the DIVISION, CORPS, ARMY, and COWMZ columns are the percentage distributions in each respective area with reference to the TOTAL BRANCH for each echelon; e.g., of 7591 men assigned to the OS Engineer Branch (the number 7991 comes from Display 2), 961 men are performing functions for subordinate units; of the 961 men, or 4.66% of the Engineer Branch, are assigned to the 5th echelon; of the 354 men, or 62.15%, are in the Corps area, and 134 men, or 37.83%, are in the COCHZ area. The summary information listed is found by totaling the personnel strength columns individually for each area and total branch. For completeness of analysis, Displays 2, 6, 8, and 9 should be requested in conjunction with Display 7. For illustration only the OS Engineer Branch is shown. The length of this display will vary from 1 to 25 computer pages, depending upon the composition and size of the force stratified

SUMMARY PRIMARY MISSION INFORMATION FOR OS ENGINEER BRANCH

PEN IN BRANCH
NEN IN UIVISION AMEA = 2304
FEN IN CHAS AMEA = 1558
FEN IN COMMZ AMEA = 529

DISCUSSION: Display 8 is available for each branch and reflects each branch's manpower distribution on the primary mission of the entire force. The TUTAL BRANCH column shows the number and percentage of the assigned manpower in a particular branch who are performing the primary mission of the branch. The percentage in the DIVISION, CORPS, ARMY, and COMMZ columns are the percentage distributions in each respective area with reference to the TOTAL BRANCH columns. For example, of the 7591 men assigned to the 05 Engineer Branch (the number 7591 comes from Distributed the 05 Engineer Branch (the number 3591 men, or 4.19% are in the COMMZ area, and 38 men, or 4.19% are in the COMMZ area, and 38 men, or 4.19% are in the COMMZ area, and 38 men, or 4.19% are in the COMMZ area, and 38 men, or 4.19% are in the COMMZ area, and 38 men, or 4.19% are in the COMMZ area, and 38 men, or 4.19% are in the COMMZ area, and 38 men, or 4.19% area and total branch. For completeness of analysis, Displays 2, 5, 7, and 3 should be requested in conjunction with Display 8. For illustration, only the C5 Engineer Branch is shown. The length of this display will vary from 1 to about 25 computer pages, depending upon the composition and size of the force stratfiled.

DISCUSSION: Display 9 is available for each branch and reflects manpower distribution data on the force's secondary missions. The TOTAL BRANCH column shows the number and percentage of the assigned manpower within a particular branch who perform external functions that are not the primary mission of the branch, e.g., the Pathfinder Platoon in an Aviation Battalion of an Afrborne Division. The percentages in the DIVISION, CORPS, ARMY, and COMIZ columns are the percentage distributions in each respective area with reference to the TOTAL BRANCH for each echelon; e.g., of the 7591 men assigned to the 05 Engineer Branch (the number 7591 comes from Display 2), 15 men are performing external missions other than the primary mission; of the 15 men, all 15, or 0.20% of the 05 Engineer Branch, are assigned at the 3rd echelon; of the 15 men, or 40% are in the COWMZ area. The summary information listed is found by totaling the personnel strength columns individually for each area and total branch. For completeness of analysis, Displays 2, 6, 7, and 8 should be requested in conjunction with Display 9. For illustration, only the 05 Engineer Branch is shown. The length of this display will vary from 1 to about 25 computer pages, depending upon the composition and size of the force stratified.

CALL CONTRACTOR OF THE CONTRAC

DISCUSSION: Display 10 lists the manpower distribution of the stratified force by SRC, MOS, and function. Each MOS in the force for listed by SRC, quantity of SRCs in the force, the quantity of SRCs in the force, the quantity of SRC, quantity of SRC and the FSS function performed by this MOS. For example, using line 2 as an example, the SRC is 06426H300 and the quantity of SRC's in the force is 2. The MOS is 13A00 with a quantity of 5 in each SRC and a total quantity of 10 of these MOSs in the force. The FSS function being performed by this MOS is 4, Mortar, Rocket and Artillery Support. This sample display illustrates only one of the SRCs contained in the force. The length of this display will vary from 1 to about 100 computer pages, depending upon the composition and size of the force stratified.

DISPLAY -10A	FUNCTION PERFORMED BY MOS AND ASI	でよした できらくの りょうり さいしょう しょうしょ ちゃっちゃ ちゃっちゃ ちゃっかん ちょうしょう こうしょう しょう しょうしょう しょうしゅう しょうしょう しょうしょう しょうしょう しゅうしょう しょうしょう しょうしょう しょうしょう しょうしょう しょうしょう しょうしょう しょう	!

OWER DISTRIBUTION BY SRC, MOS AND ASI,	S THI		
*MANPOWER DISTRIBUTION BY SRC, MOS A	GUANTITY OF MOS - IS SRC IN THE IN THI STRC SRC		

This DISCUSSION: Display 10A is the same as Display 10 with an added column for ASIs (Additional Skill Identifier) located to the right of the MOS. An MOS will be repeated for each different ASI listed for that MOS. As an example MOS 13A00 was listed once on Line 2 of Display 10, in this display it is listed three times, lines 2, 3, and 4. Line 2 has no ASI listed for the MOS, line 3 has ASI 5H assigned to MOS 13A00 and line 4 has two ASIs, 5H and 5M. There are cases where an ASI will change the function of an MOS. MOS 11B which is normally function 1, Infantry, however if an ASI of R6, Redeye Operations, is used with this MOS the function will change to 7, Air Defense. The cases where the functions of an MOS are changed are minor and will occur mostly with aviator officer or warrant officer SSIs and MOSs and is dependent upon the aircraft being piloted, e.g., attack helicopter or passenger aircraft. This display will always be larger than display 10 for the same force and will vary from one to over one hundred computer pages.

DISCUSSION: Display 11 provides the SRC distribution by function, for each of the SRCs in the stratified force and designates the SRC and the quantity of each SRC with personnel performing the specified function. For example, there are three SRC 06157H000 units in the total force that have personnel performing the Wire Communications Function Number 25. This sample display illustrates only one of the FSS functions, Functions, Functions, Functions, Functions of the force stratified.

64 FSS functional areas. It also 11sts, by function, the per capita recurring (annual costs, as well as the per capita non-recurring costs for personnel and equipment. The total combined per capita costs are provided for each of the personnel assigned to the various functions. For example, the average, or per capita, cost of cach of the 8806 men performing the Infantry function, Function Number 1, is \$11,223.45 per year, and each man requires an average of \$5780.80 worth of equipment, for a total per capita recurring cost of \$17,004.65. The average into tial investment cost allocated for each man is \$3825.11, plus \$961.50 per man for equipment, for a total per capita non-recurring cost of \$4726.63. The resulting per capita TOTAL COST is the summation of the recurring costs and the non-recurring costs. For illustration, only a portion of the 64 FSS functions for the total force is shown. The length of this display will vary from 6 to about 78 computer pages, It provides the total number of men assigned to each of the Display 12 is available for each branch and for the total force. depending upon the composition and size of the force stratified D15CUSS10:4:

DISCUSSION: Display 13 is available for each branch and for the total force. It provides the percentage of the total manpower in a branch or force devoted to each of the 64 FSS functional areas, as well as the percentage of the recurring (annual) and non-recurring costs attributable to each FSS functional area. Percentage costs are provided for both men and equipment. For example, 4.23% of the men in the total force are performing the Arnor function Number 2. They utilize 4.35% of the anapower and 7.69% of the equipment recurring costs for an overall recurring costs. In the initial manpower costs and 18.85% of the initial equipment non-recurring costs, for an overall average of 14.30% of all non-recurring costs. They have a combined allocation of 10.03% of the total recurring and non-recurring costs. For illustration, only the first 22 functions for the total force are shown. The length of this display will vary rom 6 to about 78 computer pages, depending upon the composition and size of the force stratified.

DISCUSSION: Display 14 is available for each branch and for the total force. It provides the per capita recurring (annual) manpower and equipment costs for each of the 64 FSS functions by area; i.e., Division, Corps, Army, and CORMY. For example, \$44,060.00 in recurring costs are allocated for each man to perform the Aerial Fire function, Function Number 6, at the Division Level, \$26,572.00 of which is considered to be manpower cost and \$17,4860 is equipment cost. The per capita cost allocated at the Corps level is \$33,640.00 - \$27,042.00 for manpower and \$6597.00 for equipment, A total of \$121.00 per capita is allocated at the Army level, all of which is applied to equipment cost. For fillustration, only the first 22 functions of the total force are shown. The length of this display will vary from 6 to about 78 computer pages, depending upon the composition and size of the force stratified.

Corps, Army, and COMIZ. For example, 10.42% of the recurring manpower cost and 13.45% of the recurring equipment and total cost by area; i.e., Division level are used in support of the Mortar, Rocket, and Artillery Support function, Function Number 4. This is an average of 11.62% of the total recurring costs utilized at the Division level. Function 4 also utilized at the Corps level. Function at also utilized 12.26% of all recurring costs at the Corps level. Function and 11.41% of the equipment cost at the total force is shown. The length of this display will vary from 6 to about 78 computer pages, depending upon the composition and size of the force stratified.

DISCUSSION: Display 16 is available for each branch and for the total force. It provides the per capita recurring (annual) manpower and equipment costs for each echelon below Theater Army and reflects the combined cost distribution within each area; i.e., Division, Corps, Army, and CUMMI. The display also provides information for each area on the percentages of the total resources consumed at each echelon. For example, the recurring per capita allocation for use by the 4th echelon in the Division area; as 13.543.00 for ampower, \$7007.00 for equipment, for a combined total of \$20,550.00 per man per year, \$450 of the total utilization at the 4th echelon is designated for use in the Division area; and 12.5% of all costs used in the Division area is utilized by the 4th echelon. Finally, 17% of the total recurring per capita costs in the theater are due to forces located four echelons below the theater. For illustration, only total force data is shown. The length of this display will vary from 2 to about 26 computer pages, depending upon the composition and size of the force stratified.

*PERCAPITA RECURRINGIREC) AND NON-RECURRING COSTS FOR TOTAL FORCE BY COMMAND LEVEL AND BY AREA

DISCUSSION: Display 17 is available for each branch and for the total force. It provides the recurring (annual) and non-recurring per capital costs for each command echelon from Army, Corps, and Division through Brigade, Battalion, Company, and Team. Cost information is provided by area for manpower, equipment, and combined total costs. For example, of the total recurring costs designated for the total force, \$20,299.00 are allocated for use by the Brigade in the Corps area, 0f this value, \$16,290.00 are designated as manpower costs and \$4009.00 as equipment costs. Uf the SIU,148.00 designated as non-recurring costs for use at the Brigade level in the Corps area, \$7027.00 are allocated as manpower costs and \$3120.00 as equipment costs. These per capita costs are figured on the basis of the 612 men assigned at the Brigade level in the Corps area. For illustration, only total force data is shown. The length of this display will vary from 2 to about 26 computer pages, depending upon the composition and size of the force stratified.

nen and equipment. The display breaks down the percentage of total branch per capita cost that is attributable to recurring and non-recurring cost and the percentage of the total branch to each Branch. for example, the 5037 men in the 11 Signal Branch are 5.16% of the total force cost attributable to each Branch. for example, the 5037 men in the 11 Signal Branch are 5.16% of the total branch cost is allocated for recurring amprower costs, and 19.43% of the total branch cost is allocated for non-recurring amprower. Of the total Signal Branch cost, 24.30% is utilized by manpower costs, consequently, 42.85% of the branch cost is utilized by manpower costs. Consequently, 42.85% of the branch is 4.92% of all manpower recurring equipment costs, and 18.55% is utilized by non-recurring costs, and 4.93% of all manpower recurring costs, and 4.93% of all manpower costs are dedicated to the 18.59% of all manpower costs are broken out. Specifically, 5.18% of all equipment costs are broken out. Specifically, 5.18% of all seventh costs are broken out. Specifically, 5.18% of all seventh costs are broken out. Specifically, 5.18% of all seventh costs are broken out. Specifically, 5.18% of all seventh costs are allocated to the branch. This sample display illustrates only a portion of the branches contained force. The length of this display will vary from 1 to about 13 computer pages, depending upon the composition and size of the The display lists the number and percentage of the force assigned to each branch and the corresponding per capita costs (both recurring and non-recurring) Uisplay 13 provides total force summary information for both manpower and equipment and the combined totals.

enlisted personnel strengths at each echelon below theater army and each area. The supervisory ratio (SUP RATIO) is calculated by dividing the number of enlisted personnel by the total number of officers, warrant officers, and NCOs. For example, the supervisory ratio for the personnel performing at the 4th echelon in the Division area is 2.0222 enlisted personnel per supervisor. This is determined by dividing 4467, the number of enlisted personnel, by 2209, the combined total of 1028 officers and warrant officers and 1181 NCOs. This sample display illustrates only the total force. The length of this display will vary from 2 to about 26 computer pages, depending upon the composition and size of the force stratified.

DISCUSSION: Display 20 is available for each branch and for the total, force. It is similar to Display 19 and presents information on officer, RICD, and enlisted strengths for each of the 64 FSS functions by area. The supervisory ratio is calculated by dividing the number of enlisted personnel by the total number of officers, warrant officers, and NCOs. For example, the supervisory ratio for the personnel performing the Infantry Function, Function Number 1, within the Division area is 2.3116 enlisted personnel per supervisor. This is determined by dividing 6135, the number of enlisted personnel by 2654, the combined total of 504 officers and warrant officers, and 2150 NCOs. This sample display illustrates only a portion of the 64 FSS functions. The length of this display will vary from 16 to about 208 computer pages, depending upon the composition and size of the force stratified.

DISCUSSION: Display 21 contains summary data for MTOE/TDA units for the 64 FSS functional areas, i.e., the number and percent of total force personnel devoted to each functional area, ratio of military to civilian personnel, number and percent of high grades (Major and above, GS-13 and above), ratio of GS to WB personnel, and per capita personnel costs. For illustration, only the first 22 functions are shown. The length of this display is 3 computer pages regardless of the composition and size of the force stratified.

NOTE: This display is only available for MTOE/TDA stratification.

DISCUSSION: Display 22 provides data by count rather than by ratios or comparison. It lists the number of enlisted, warrant officer, and officer personnel for each of the 64 FSS functions. It also lists the number of General Service (GS) Wage Board (WB), wage supervisor (WS), work leader (WL), and work grade (WG) personnel for each function. For illustration, only the first 22 functions are shown. The length of this display is 3 computer pages regardless of the composition and size of the force stratified.

NOTE: This display is only available for MTOE/TDA Stratification.

DISCUSSION: Display 24 provides a listing of selected equipment by line item number (LIN), which is contained in the specific SRs stratified in the selected force. Its purpose is to allow an aggregation of items of equipment within any force. Each selected LIN contained within the force is identified by LIN and by nomenclature. The display designates the SRCs in which the specific LINs are found, the quantity of each LIN within each SRC, and the quantity of each SRC within the stratified force as well as the total of each LIN in the force. For illustration, only one of the LINs stranged, The total quantity of LIN 894977 in the force is the summation of the values determined by multiplying the quantity of LIN in R94977 in the force is the summation of the values determined by multiplying the accurately because the length will vary depending on the composition and size of the force and the number of LIN selected.

NOTE: When requesting Display 24, it is necessary to specify each selected LIN.and Uncir associated level of strangthy and the quantity of each FNG in the force.

DISCUSSION: Display 25 provides a listing of personnel by MOS and grade contained in the SRCs stratified in the selected force. The purpose of this display is to aggregate selected MOSs and grades according to SRCs within a total force. The quantity of each selected MOS and each selected grade is provided for each SRC in the force, along with the total quantity in the force. For illustration, only one SRC, SRC 051661000, at level of strength of 1 (100%) is shown. There are is attiliers surveyors with MOS 82C10 and grade of E-4 in this SRC. However, since there are 2 SRC 0616611000 units within this force, there are 12 surveyors with MOS 82C10 and of grade E-4 in the force. For illustration, only MOS 82C10 and NOS 82C20 are shown for SRC 0616611000. The length of this display cannot be estimated accurately because the length will vary depending on the composition and size of the force and the MOSs and grades selected.

NOTE: When requesting Display 25, it is necessary to specify

<u>DISCUSSION</u>: Display 26 is a detailed per capita cost listing of personnel SSIs and MOSs in the force broken out for each SRC, the paragraph, grade and function. It provides the SRC number, the level of strength of the SRC, the paragraph number of the SRC, the number of SRCs in the force, the individual (s) SSI or MOS, the grade of the individual (s), the number of personnel on this paragraph line. the FSS function being performed and the per capita cost for each individual for Nonrecurring (Initial) and Recurring (Annual) costs. For example, the first line lists the SRC as DIIZZHIDO with a level of strength as 1, the SRC paragraph is 1, and the number of SRCs in the force is 4. The MOS is 15400 with the grade of 04 (Major). There is only 1 person on this paragraph line performing FSS function 17, Air Movement. The last two columns give the per capita cost for this individual in Nonrecurring (Initial) and Rezurring (Annual) dollars. The total cost for all individuals is not listed. The length of this display will vary from 1 to about 25C computer pages depending upon the composition and size of the force stratified.

DISCUSSION: Display 27 is a detailed equipment cost listing for each Line Item Number (LIN) in the force. It is broken out for each SRC baragraph limits paragraph limits paragraph limits paragraph limits paragraph limits paragraph limits paragraph limits and the Nonrecurring and Recurring cost in dollars. Using the second line as an example, the SRC number is 06426H300, the paragraph is 1 and the LIN is M11895. The number of LINs on this paragraph line is 11 with a Nonrecurring (Initial) cost of \$26 for each piece of equipment.

Recurring (Annual) cost for each piece of equipment is \$3. Since the LINs are listed by paragraph line, a LIN may appear numerous times in a listed SRC. The length of this will vary from I page to about 400 computer pages, depending upon the size and composition of the force stratified.

APPENDIX B

SAMPLE REQUEST FOR STRATIFICATION

SECURITY CLASSIFICATION [IF APPLICABLE]

ORGANIZATIONAL HEADING

SUBJECT: Request for Force Stratification of (Unit or Force to be

Stratified)

Director

US Army TRADOC Systems Analysis Activity ATTN: ATAA-TGR

White Sands Missile Range, New Mexico 88002

1. This headquarters has a requirement to stratify the forces listed below (or attached as Inclosure 1). The results will be used to evaluate various personnel staffing aspects of the forces in various scenarios.

	SRC	Level of Strength	Quantity of SRC
FORCE I	05305G600 07028G920 17017H010	1 1 2	1 1 3
FORCE II	11176H200 11177H200 11178H200	1	2 4 1

- 2. Request Force Stratification Analysis Reports (FSARs), copies each, be forwarded to arrive this organization by (required date). The FSAR displays required are F1, 1, 1A, 12, and 20.
- 3. Use of the above listed SRCs is reflected in TRADOC Pamphlet 310-4, dated _____.

4.	Point of	contact within	this	organization	15
